

STUDIES OF THE EDİRNE KETEM FOR THE YEAR 2006

**Dr. Leyla Öner
Dr. Hülya Yoleri**

Cancer Early Diagnosis and Screening Center (KETEM), Edirne State Hospital

AIM:

To assess the clinical breast examination, mammography, breast ultrasonography, gynaecological examination and pap-smear sampling, colposcopy and skin cancer examination results of the Edirne State Hospital's Cancer Early Diagnosis and Screening Center that were acquired in 2006.

MATERIALS and METHOD:

This presentation has been prepared by investigating the KETEM Patient Files between the dates 01.01.2006 and 31.12.2006. These files were of patients who had directly presented to the Centre or those who had been referred to the Centre with the request of mammography or breast ultrasonography by other polyclinics.

FINDINGS:

In 2006, there were 4366 presentations to the KETEM Breast Polyclinic. Each of these cases underwent breast examinations and other appropriate examinations dependant upon their age group and risk factors. 2079 mammograms and 1668 ultrasonographs were taken. Of those who had directly presented to the KETEM, 113 cases were treated as suspected cases and were monitored. 15 of these cases were diagnosed with breast cancer.

DATA OF THE BREAST HEALTH CARE CENTRE BY YEAR				
Year	No. Of Presentations	Clinical breast examinations	Mammography	Breast USG
2004	1837	1837	1265	1080
2005	4119	4119	2316	2121
2006	4366	4366	2079	1668

There have been 703 presentations to the Cervix Polyclinic, 679 pap-smears have been taken. Colposcopy was conducted on 35 cases and 18 were assessed as suspected cases. The result of the cervical biopsy taken from one of the cases was CIN I.

DATA OF THE CERVICAL HEALTH CARE CENTRE BY YEAR			
Year	No. Of Presentations	Pap-smear	Colposcopy
2004	111	111	0
2005	839	839	55
2006	703	679	35

Eleven patients with suspected lesions found during the skin examinations are being monitored by dermatology specialists. There have been no cases of diagnosis of skin cancer at the Centre in the year 2006.
